INTRODUCTION

This application note applies to XLamp® XH Family LEDs, which have order codes in the following format.

XHxxxx-xx-xxxx-xxxxxxxxx

This application note explains how XLamp XH Family LEDs and assemblies containing these LEDs should be handled during manufacturing. Please read the entire document to understand how to properly handle XLamp XH Family LEDs.

**HANDLING XLAMP® XH FAMILY LEDS**

**Manual Handling**

Use tweezers to grab XLamp XH Family LEDs at the base. Do not touch the lens with the tweezers. Do not touch the lens with fingers. Do not push on the lens.

Do not apply more than 500 g of shear force onto the lens of an XLamp XH-B LED. Do not apply more than 1000 g of shear force onto the lens of an XLamp XH-G LED. Excessive force on the lens could damage the LED.

![Correct vs Wrong Handling](image)

Cree recommends the following at all times when handling XLamp XH Family LEDs or assemblies containing these LEDs:

- Avoid putting excessive mechanical stress on the LED lens.
- Never touch the optical surface with fingers or sharp objects. The LED lens surface could be soiled or damaged, which would affect the optical performance of the LED.
- Cree recommends always handling XH Family LEDs with appropriate ESD grounding.
- Cree recommends handling XH Family LEDs wearing clean, lint-free gloves.

Whenever possible, Cree recommends the use of a pick & place tool to remove XLamp XH Family LEDs from the factory tape & reel packaging.
Pick & Place Nozzle

For pick and place nozzles coming into contact with silicone-covered LED components, Cree recommends nozzles be constructed of non-metallic materials. Cree and several of Cree’s customers have had good success using nozzles fabricated from 95a urethane. The following pick & place tool example is specific to the XH Family LEDs.

All dimensions in mm.
Measurement tolerance: .xx = ±0.025 mm

CIRCUIT BOARD PREPARATION & LAYOUTS

Printed circuit boards (PCBs) should be prepared and/or cleaned according to the manufacturer’s specifications before placing or soldering XLamp XH Family LEDs onto the PCB.

The diagram below shows the recommended PCB solder pad layout for XLamp XH Family LEDs.

All dimensions in mm.
Measurement tolerance = ±0.13 mm
CASE TEMPERATURE (\(T_s\)) MEASUREMENT POINT

XLamp XH Family LED case temperature (\(T_s\)) should be measured on the PCB surface, as close to the LED’s base as possible. This measurement point is shown in the picture below. Connect the thermocouple at a point where the voltage potential is below the rating for the meter. XH Family LEDs do not have an isolated thermal pad and care should be exercised to avoid bridging the anode and cathode together, which may occur if the thermocouple bead is large. Cree recommends using a 36 AWG (0.01267 mm²) thermocouple wire for \(T_s\) measurements.

It is not required to use a solder footprint for the thermal pad that is larger than the XLamp XH Family LED itself. In testing, Cree has found such a solder pad to have insignificant impact on the resulting \(T_s\) measurement.

NOTES ON SOLDERING XLAMP® XH FAMILY LEDS

XLamp XH Family LEDs are designed to be reflow soldered to a PCB. Reflow soldering may be done by a reflow oven or by placing the PCB on a hotplate and following the reflow soldering profile listed on page 6.

Do not wave solder XLamp XH Family LEDs. Do not hand solder XLamp XH Family LEDs.
XLAMP® XH FAMILY SOLDERING & HANDLING

Solder Paste Type
Cree strongly recommends using “no clean” solder paste with XLamp XH Family LEDs so that cleaning the PCB after reflow soldering is not required. Cree uses Kester® R276 solder paste internally.

Cree recommends the following solder paste compositions: SnAgCu (tin/silver/copper) and SnAg (tin/silver).

Solder Paste Thickness
The choice of solder and the application method will dictate the specific amount of solder. For the most consistent results, an automated dispensing system or a solder stencil printer is recommended. Cree has seen positive results using solder thickness that results in a 4-mil (102-μm) bond line, i.e., the solder joint thickness after reflow soldering.

After Soldering
After soldering, allow XLamp XH Family LEDs to return to room temperature before subsequent handling. Handling of the device, especially around the lens, before cooling could result in damage to the LED.

Cree recommends verifying that soldered LEDs are not tilted, a situation called tombstoning. As a general guideline, an LED is tilted when the part has a low edge touching the PCB surface and a high edge above the PCB surface.

Cree recommends verifying the solder process by checking the consistency of the solder bond of several trial PCBs after reflow. This can be done by X-ray or by shearing selected devices from the circuit board. The solder should appear completely re-flowed (no solder grains evident). The solder areas should show minimum evidence of voids on the backside of the package and the PCB.

Cleaning PCBs After Soldering
Cree recommends using “no clean” solder paste so that flux cleaning is not necessary after reflow soldering. If PCB cleaning is necessary, Cree recommends the use of isopropyl alcohol (IPA).

Do not use ultrasonic cleaning.

MOISTURE SENSITIVITY
Cree recommends keeping XLamp LEDs in the provided, resealable moisture-barrier packaging (MBP) until immediately prior to soldering. Unopened MBPs that contain XLamp LEDs do not need special storage for moisture sensitivity.
Once the MBP is opened, XLamp XH Family LEDs may be stored as MSL 1 per JEDEC J-STD-033, meaning they have unlimited floor life in conditions of ≤ 30 °C/85% relative humidity (RH). Regardless of storage condition, Cree recommends sealing any unsoldered LEDs in the original MBP.

**XLAMP® XH FAMILY LED REFLOW SOLDERING CHARACTERISTICS**

In testing, Cree has found XLamp XH Family LEDs to be compatible with JEDEC J-STD-020C, using the parameters listed below. As a general guideline, Cree recommends that users follow the recommended soldering profile provided by the manufacturer of the solder paste used, and therefore it is the lamp or luminaire manufacturer's responsibility to determine applicable soldering requirements.

Note that this general guideline is offered as a starting point and may require adjustment for certain PCB designs and configurations of reflow soldering equipment.

CHEMICALS & CONFORMAL COATINGS

Below are representative lists of chemicals and materials to be used or avoided in LED manufacturing activities. For a complete and current list of recommended chemicals, conformal coatings and harmful chemicals consult Cree’s Chemical Compatibility Application Note. The video at www.youtube.com/watch?v=t24bf9D_1SA illustrates the process Cree has developed for testing the compatibility of chemicals and materials with LEDs. You should also consult your regional Cree Field Applications Engineer.

Recommended Cleaning Solutions
Cree has found the following chemicals to be safe to use with XLamp XH Family LEDs.
- Water
- Isopropyl alcohol (IPA)

Chemicals Tested as Harmful
In general, subject to the specifics in Cree’s Chemical Compatibility Application Note, Cree has found certain chemicals to be harmful to XLamp XH Family LEDs. Cree recommends not using these chemicals anywhere in an LED system containing XLamp XH Family LEDs. The fumes from even small amounts of the chemicals may damage the LEDs.
- Chemicals that might outgas aromatic hydrocarbons (e.g., toluene, benzene, xylene)
- Methyl acetate or ethyl acetate (i.e., nail polish remover)
- Cyanoacrylates (i.e., “Superglue”)
- Glycol ethers (including Radio Shack® Precision Electronics Cleaner - dipropylene glycol monomethyl ether)
- Formaldehyde or butadiene (including Ashland® PLIOBOND® adhesive)

Hermetically Sealing Luminaires
For proper LED operation and to avoid potential lumen depreciation and/or color shift, LEDs of all types must operate in an environment that contains oxygen. Simply allowing the LEDs to ventilate to air is sufficient; no extraordinary measures are required. Hermetically sealing LEDs in an enclosed space is not recommended.
**ASSEMBLY STORAGE & HANDLING**

Do not stack PCBs or assemblies containing XLamp XH Family LEDs so that anything rests on the LED lens. Force applied to the LED lens may result in the lens being knocked off. PCBs or assemblies containing XLamp XH Family LEDs should be stacked in a way to allow at least 1 cm clearance above the LED lens.

Do not use bubble wrap directly on top of XLamp XH Family LEDs. Force from the bubble wrap can potentially damage the LED.
TAPE AND REEL

All Cree carrier tapes conform to EIA-481D, Automated Component Handling Systems Standard.

Except as noted, all dimensions in mm.

The diagrams below show the packaging and labels Cree uses to ship XLamp XH Family LEDs. XLamp XH Family LEDs are shipped in tape loaded on a reel. Each box contains only one reel in a moisture barrier bag.

**Unpackaged Reel**
- Label with Cree Bin Code, Quantity, Reel ID

**Packaged Reel**
- Dessicant (inside bag)
- Humidity Indicator Card (inside bag)
- Label with Cree Order Code, Quantity, Reel ID, PO #
- Label with Cree Bin Code, Quantity, Reel ID

**Boxed Reel**
- Label with Cree Order Code, Quantity, Reel ID, PO #
- Label with Cree Bin Code, Quantity, Reel ID
- Patent Label (on bottom of box)
